

# KEYpak<sup>®</sup>

## LAN

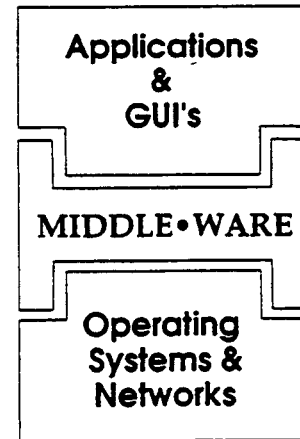

*"World Leader in Open Document Exchange Solutions"*

### Product Description

KEYpak is the name for a family of products that provide document conversion services on many different computer platforms. KEYpak LAN is the product class name for KEYpak technology running on Desktop Computers and LAN file servers.

KEYpak LAN is a "middle-ware" application. It is designed to be called by other applications rather than being called directly by a user.

### Introduction

Local Area Networks (LANs) provide the data pipes that tie desktop computers together, allowing them to share printers, disks and files. KEYpak provides the application level interoperability that can make the difference between a simple connection for sharing peripherals, and a cohesive corporate information system.

In most major corporations there are a variety of desktop operating systems being used, including DOS, Windows, OS/2, UNIX and Mac OS. The variety of word processing applications running on these computers is even more diverse. KEYpak opens the door to productive information sharing on heterogeneous LANs by providing a comprehensive set of high quality document transforms. WordPerfect, Microsoft Word, and WordStar users can share documents on the LAN as easily as they share messages over the electronic mail system.

KEYpak LAN allows document conversion services to be seamlessly integrated into other applications such as electronic mail or document management systems. Complete documentation is provided on the Application Program Interfaces (APIs) that are provided to connect KEYpak LAN to other applications. The following is a list of the Desktop Operating Systems and the interfaces supported by KEYpak LAN:

#### MS-DOS

- *Command Line Interface*
- *C callable API*
- *Menu Driven User Interface*
