

KEYpak[®] +1

"World Leader in Open Document Exchange Solutions"

Product Description

KEYpak+1 gives Digital ALL-IN-1 Integrated Office System (IOS) users the ability to upload, download, read, edit or send foreign documents from within the ALL-IN-1 forms environment. KEYpak+1 includes an optional viewer allowing users to view mail attachments without leaving ALL-IN-1 and without having the original word processing application available. This optional viewer can be ordered when KEYpak+1 is originally installed or added at a later date.

KEYpak+1 is a user interface that integrates KEYpak document conversion software with the ALL-IN-1 office system. It facilitates the transfer of documents from an external storage area using the document transfer protocol of choice. ALL-IN-1 users can choose between the eight standard transfer protocols supplied with KEYpak+1. These transfer protocols provide up and down loading of files between the ALL-IN-1 file cabinet and file storage areas outside the users' environment such as Personal Computers, VMS file cabinet and other networked hosts or mail systems. Users exchange external documents originating outside ALL-IN-1 through Electronic Messaging, Document Transfer, or ALL-IN-1 File Cabinet, while preserving the editability of these documents.

Introduction

Office systems are evolving from server-based applications with terminal access to intelligent terminals providing users a unique work area through applications of their choice. Some organizations, however, continue to rely on traditional terminal and terminal emulator environments. Digital's ALL-IN-1 Integrated Office Solution (IOS), also called Classic, is a forms driven product designed to provide server based office applications for traditional terminal clients. Over the past several years Keyword has been supplying integration, viewing and converter solutions for ALL-IN-1 installations. These solutions are particularly critical for installations seeing an influx of PC and Macintosh users or where the operation must have access to enterprise wide networks.

There are two versions of KEYpak+1, Version 3 integrates into All-IN-1 Version 3 and Version 1.3 integrates into all previous ALL-IN-1 versions. Both KEYpak+1 versions include the optional viewer.

KEYpak+1 Viewer

The viewer is integrated into KEYpak+1 to allow viewing of a mail attachment in its final formatted form on screen. The viewer also allows users to browse files within the file cabinet.

While reading a mail message, the KEYpak+1 Viewer determines the format of the attached document. If KEYpak recognizes the document format, the
